16-21 July 2017 · Barcelona

The World Health Organisation considers equitable access to effective, safe and affordable drugs, diagnostic devices and preventive tools such as vaccines as vital to the attainment of the highest possible standard of health by all, i.e.: the right to health. It is also a key component of the Sustainable Development Goal number 3, that proclaims “Health for All” as the shared vision of the international community to be reached in 2030. Furthermore, access to treatment is a cornerstone of Universal Health Coverage, without which households risk to be impoverished when facing catastrophic health-related expenditures.

Despite that, large parts of the world population do not have access to the tools that will prevent them from being ill, or progress in their diseases, or even die. This could be because either the quality medicines they need exist but are not affordable or accessible to them, or because the disease they experiment has no treatment as it has been neglected by the current research & development model.

The Barcelona Global Health Summer School 2017 will gather key experts in the field to address the causes, contexts, and consequences of the inequitable access to medicines and what to do about it.

Barcelona Global Health Summer School 2017
