

Risk Gene for Alzheimer’s Disease May Aggravate the Health Effects of Air Pollution on Neurodevelopment in Children

Children carrying the $\epsilon 4$ variant of the APOE gene may be particularly vulnerable to the detrimental effects of air pollutants on the brain

BARCELONA, 6 September 2018. There is growing evidence that exposure to air pollution adversely affects cognitive and behavioural development in children. However, the mechanisms underlying this association are, as yet, unknown. Now, the findings of a [new study](#) from the Barcelona Institute for Global Health (ISGlobal), an institute supported by the “la Caixa” Banking Foundation, suggest that the **$\epsilon 4$ variant of the APOE gene** may play a significant role in this process. The study has been published in the journal *Environmental Health Perspectives*.

Previous studies carried out within the framework of the [BREATHE project](#) have linked childhood exposure to air pollution with [diminished cognitive development](#), [increased behavioural problems](#), and even [structural differences in the brains](#) of the children studied.

In the new study, which analysed data from over **1,600 children attending 39 schools in Barcelona**, scientists observed that **the association between exposure to traffic-related pollution and adverse effects on neurodevelopment was more marked in the children who carried the $\epsilon 4$ allele of the APOE gene**. Carriers of this genetic variant had higher behaviour problem scores and their attention capacity developed more slowly. Moreover, the volume of the caudate nucleus, an anatomical brain structure, tended to be smaller in that population.

“These findings suggest that **children who carry this allele could be more vulnerable to the detrimental effects that air pollution** has on important aspects of their neurodevelopment,” explained Silvia Alemany, ISGlobal researcher and lead author of the study

Neurodegenerative Diseases

“Systemic inflammation and oxidative stress are two of the most well-established mechanisms underlying the adverse health effects of air pollution. Interestingly, both these mechanisms are also involved in the pathogenesis of dementia. In fact, research has demonstrated an association between exposure to air pollution and cognitive impairment in older people. All these considerations, and the fact that **APOE $\epsilon 4$ is the most important known genetic risk factor for Alzheimer’s disease**, led us to wonder whether the allele might also have a relationship with the adverse effects air pollution has on brain function in children,” says Silvia Alemany.

Genetic data were available for all of the participants. Tests were carried out to evaluate cognitive functions, behavioural problems and possible symptoms of attention deficit hyperactivity disorder.

Traffic-related air pollution levels were calculated on the basis of actual measurements. Magnetic resonance imaging data were available for 163 of the study participants.

“More research will be needed in other populations to replicate these results and we need to establish whether this possible genetic vulnerability also applies to exposure to air pollution during earlier stages of development, for example, in the prenatal period,” warns ISGlobal researcher Jordi Sunyer, director of the BREATHE project. “In any case, once again the findings are clear: it is **essential to implement measures to reduce traffic in the urban environment** and, particularly, in places where children are present, such as the areas around schools.”.

About ISGlobal

The Barcelona Institute of Global Health (ISGlobal) is the result of an innovative alliance between the “la Caixa” Foundation and academic and government institutions. The Institute was set up to contribute to the work undertaken by the international community to address global health challenges. ISGlobal has consolidated a hub of excellence in research and medical care that has its roots in work first started in the world of health care by the Hospital Clínic and the Mar Health Park and in the academic sphere by the University of Barcelona and Pompeu Fabra University. The pivotal mechanism of its work model is the transfer of knowledge generated by scientific research to practice, a task undertaken by the Institute’s Education, Policy, and Global Development departments. ISGlobal is a member of CERCA, the Catalan Government’s network of research centres.
